CASE STUDY

QA UPGRADE

FOR BETTING PLATFORM

PROJECT OVERVIEW

A wagering platform covering horse racing, sports, and lotto.

It was already in production while still undergoing active development.

CHALLENGES

- to accelerate the development and release cycles and remain competitive
- to mature the existing QA approach and find critical bugs before the regulator reviews
- to ensure platform stability and quality for a live product

SOLUTION

- Deployed a multi-level testing strategy covering API, integration, and regression tests.
- Conducted in-depth requirements analysis to detect issues proactively.
- Embedded a QA specialist directly into the client's scrum team.

RESULTS

Increased functional test coverage **from 67% to 96%**

Shortened the regression testing cycle **by 15%,** accelerating time-to-market for new features

Improved early-stage detection, reducing the number of critical bugs in production **by 40%**

RESOURCES

Tools:

- Jira
- TestRail
- Postman
- Apache JMeter

Key Testing:

- Functional
- API
- Regression
- Integration

Quality is even more crucial after you go live.

Ensure the right process with us.
